Question 2

To set up new configurations -
Listing existing configs
gcloud config list

        [core]
        account = krutik.menkudle@quantiphi.com
        disable_usage_reporting = True
        project = pe-training

        Your active configuration is: [default]
This denotes the default configuration set for the account

List of all existing configurations
gcloud config configurations list

NAME	IS_ACTIVE	ACCOUNT	PROJECT	DEFAULT_ZONE	DEFAULT_REGION
default	True	krutik.menkudle@quantiphi.com	pe-training		

# So there is no default region and zone set for the account, to set the same -
$ gcloud config set compute/region us-central1
        Updated property [compute/region].
$ gcloud config set compute/zone us-central1a
        Updated property [compute/zone].

# To create new configuration -
$ gcloud config configurations create krutik-assessment
        Created [krutik-assessment].
        Activated [krutik-assessment].

# As the new configuration is created and updated, with gcloud init command, configure the settings for this configuration
$ gcloud init

To switch between two configurations having same project -
$ gcloud config configurations activate [name-of-configuration]

For this example

```
$ gcloud config configurations activate krutik-assessment
$ gcloud config configurations activate default

# Or you can navigate to other configuration using -
$ gcloud init

# To navigate between project -
$ gcloud projects list
$ gcloud config set project `PROJECT NAME`
```
